nRecommended for embroidery and embroidery and decorative stitching.nNo thread or yarn tension.nMake use of 3 kinds of thread and can easily handle.nCan be removed in four directions.nCan be placed and operated with ease.nEasy to use by beginners.nCan be used in all types of sewing machines.nAssemble with ease.nCan be securely held by a sewing needle.nRemovable.nPressure sensitive, can be used again.nSolid.nWaterproof, heat-resistant.nReinforced.nIncludes 1 x instruction manual.nFeatures.n3 kinds of thread.nCan be used in all types of sewing machines.nCan be placed and operated with ease.nEasy to use by beginners.nCan be securely held by a sewing needle.nRecommended for embroidery and embroidery and decorative stitching.nNo thread or yarn tension.nRemovable.nPressure sensitive, can be used again.nIncludes 1 x instruction manual.nMade in Japan."Q: PHP/MYSQL query with concatenation. I want to join query with field from different table I want to join two tables. Table A has columns username and password. Table B has columns ID and name. Username and password are same in table B. I want to update table B with data from table A where username and password match. I use concatenation to query table A to get a string value for username and password. \$username = \$user->username; \$password = \$user->password; \$strSQL = "SELECT name, id FROM b WHERE name = '\$username.'" AND password = '\$password.'""; This is the query i got so far. But this fails when there is no user with matching username and password. A: Try this query. Use LEFT JOIN instead of INNER JOIN. SELECT a.name, a.id FROM a LEFT JOIN b ON a.username = b.username 82157476af
